Main Theorem

Pf of Main Theorem

In neural network theory, the learning ability of a neural network is closely related to its approximating capabilities, so it is important and interesting to study the approximation properties of neural networks.

Main Theorem

Pf of Main Theorem

In P. Liu(2001) proved that continuous fuzzy-valued function can be closely approximated by a class of regular fuzzy neural networks (RFNNs) with real input and fuzzy-valued output. In this note, by using Lusin's theorem on fuzzy measure space, we show that such RFNNs is pan-approximator for fuzzy-valued measurable function.

That is, any fuzzy-valued measurable function can be approximated by the four-layer RFNNs in the sense of fuzzy integral norm for the finite sub-additive measure on  $\mathbb{R}$ .

Approximation in fuzzy mean by RFNN

Main Theorem

Pf of Main Theorem

We suppose that  $(X, \rho)$  is a metric space, and that  $\mathcal{O}$  and  $\mathcal{C}$  are the classes of all open and closed sets in  $(X, \rho)$ , respectively, and  $\mathcal{B}$  is Borel  $\sigma$ -algebra on X, i.e., it is the smallest  $\sigma$ -algebra containing  $\mathcal{O}$ . A set function  $\mu : \mathcal{B} \to [0, +\infty]$  is called *a fuzzy measure*(Narukawa/Murofushi(2004)), if it satisfies the following properties:

(FM1)  $\mu(\emptyset) = 0;$ (FM2)  $A \subset B$  implies  $\mu(A) \leq \mu(B).$ 

A fuzzy measure  $\mu$  is called *null-additive* (Wang/Klir(1992)), if for any  $E, F \in \mathcal{B}$  and  $\mu(F) = 0$  imply  $\mu(E \cup F) = \mu(E)$ ; *sub-additive* (Pap(1995)), if for any  $E, F \in \mathcal{B}$  we have  $\mu(E \cup F) \leq \mu(E) + \mu(F)$ .

Main Theorem

Pf of Main Theorem

Let  $\mathcal{F}_0(\mathbb{R})$  be the set of all bounded fuzzy numbers, i.e., for  $\tilde{A} \in \mathcal{F}_0(\mathbb{R})$ , the following conditions hold:

(i)  $\forall \alpha \in (0, 1], \tilde{A}_{\alpha} \triangleq \{x \in \mathbb{R} \mid \tilde{A}(x) \ge \alpha\}$  is the closed interval of  $\mathbb{R}$ ;

(ii) The support  $\mathrm{Supp}(\tilde{A}) \triangleq \mathrm{cl}\{x \in \mathbb{R} \mid \tilde{A}(x) > 0\} \subset \mathrm{is} \ \mathrm{a} \ \mathrm{bounded} \ \mathrm{set};$ 

(iii) 
$$\{x \in \mathbb{R} \mid \tilde{A}(x) = 1\} \neq \emptyset.$$

For simplicity, supp( $\tilde{A}$ ) is also written as  $\tilde{A}_0$ . Obviously,  $\tilde{A}_0$  is a bounded and closed interval of  $\mathbb{R}$ . For  $\tilde{A} \in \mathcal{F}_0(\mathbb{R})$ , let  $\tilde{A}_\alpha = [a_\alpha^-, a_\alpha^+]$  for each  $\alpha \in [0, 1]$  and we denote

$$|\tilde{A}| \triangleq \bigvee_{\alpha \in [0,1]} (|a_{\alpha}^{-}| \lor |a_{\alpha}^{+}|).$$

It is known that  $(\mathcal{F}_0(\mathbb{R}), d)$  is a completely separable metric space (Diamond/Kloeden(1994)).

Let T be a measurable set in  $\mathbb{R}^n$ ,  $(T, \mathcal{B} \cap T, \mu)$  finite fuzzy measure space. Let  $\mathcal{L}(T)$  denote the set of all fuzzy-valued measurable function

$$\tilde{F}: T \to \mathcal{F}_0(\mathbb{R}).$$

For any  $\tilde{F}_1, \tilde{F}_2 \in \mathcal{L}(T)$ ,  $d(\tilde{F}_1, \tilde{F}_2)$  is measurable function on  $(T, \mathcal{B} \cap T)$ , we will write a fuzzy integral norm as

$$\Delta_S(\tilde{F}_1, \tilde{F}_2) \triangleq (S) \int_T d(\tilde{F}_1, \tilde{F}_2) d\mu$$

**Proof.** By using the conclusion of (1) and Proposition 0.3 we can obtain (2). Now we only prove (1). Suppose that  $\tilde{\Phi}(x)$  is a fuzzy-valued simple function, i.e.,

$$\tilde{\Phi}(x) = \sum_{k=1}^{m} \chi_{T_k}(x) \cdot \tilde{A}_k \ (x \in T).$$

For arbitrarily given  $\epsilon > 0$ , applying Theorem 0.1 (Lusin's theorem) to each real measurable function  $\chi_{T_k}(x)$ , for every fixed  $k \ (1 \le k \le m)$ , there exists closed set  $F_k \in \mathcal{B} \cap T$  such that

$$F_k \subset L_k$$
 and  $\mu(L_k - F_k) < \frac{\epsilon}{2m}$ 

and  $\chi_{T_k}(x)$  is continuous on  $F_k$ .

Therefore, for every k there exist a Tauber-Wiener function  $\sigma$  and  $p_k \in N, v'_{k1}, v'_{k2}, \cdots, v'_{kp_k}, \theta'_{k1}, \theta'_{k2}, \cdots, \theta'_{kp_k} \in \mathbb{R}$ , and  $\mathbf{w}'_{k1}, \mathbf{w}'_{k2}, \cdots, \mathbf{w}'_{kp_k} \in \mathbb{R}^n$  such that

$$\left| \chi_{T_k}(x) - \sum_{j=1}^{p_k} v'_{kj} \cdot \sigma(\langle \mathbf{w}'_{kj}, x \rangle + \theta'_{kj}) \right| < \frac{\epsilon}{2\sum_{k=1}^m |\tilde{A}_k|}$$

for  $x \in L_k$ . Note that we can assume  $\sum_{k=1}^m |\tilde{A}_k| \neq 0$ , without any loss of generality.

Denote  $L = \bigcap_{k=1}^{m} L_k$ , then  $T = L \cup (T - L)$ . By the subadditivity of  $\mu$ , we have

$$\mu(T-L) = \mu(\bigcup_{k=1}^{m} (T-L_k))$$
$$\leq \sum_{k=1}^{m} \mu(T-L_k) < \frac{\epsilon}{2}$$

We take  $\beta_1 = 0$ ,  $\beta_k = \sum_{i=1}^{k-1} p_i$ ,  $k = 2, \dots, m$ , and  $p = \sum_{k=1}^{m} p_k$ . For  $k = 1, 2, \dots, m, j = 1, 2, \dots, p$ , we denote

$$v_{kj} = \begin{cases} v'_{k(j-\beta_k)}, & \text{if } \beta_k < j \le \beta_{k+1}, \\ 0 & \text{otherwise}, \end{cases}$$

Now we estimate the first part in the above formula. If  $x \in L$ , then for every  $k = 1, 2, \dots, m$ , we have  $x \in L_k$ , hence

$$\chi_{T_k}(x) - \sum_{j=1}^{p_k} v'_{kj} \cdot \sigma(\langle \mathbf{w}'_{kj}, x \rangle + \theta'_{kj}) \left| < \frac{\epsilon}{2\sum_{k=1}^m |\tilde{A}_k|}, \right.$$

for every  $k=1,2,\cdots,m.$  That is, for  $x\in L$ ,

$$D'_{mp} = \sum_{k=1}^{m} |\tilde{A}_k| \cdot d\left(\sum_{j=1}^{p_k} B'_{kj} - \chi_{T_k}(x)\right) < \frac{\epsilon}{2}.$$
