functions COROLLARY 2.4. The game value of Dynkin's stopping problem is expressed by the sum of two

$$v(x) = v_1(x) + v_2(x), x \in S.$$
 (2.28)

 $\in B_1 \cup C$, respectively. We note that, from (2.26) and (2.27), $v_1(x) = Pv_1(x)$, $x \in$ $B_2 \cup C$ and $v_2(x)$ $= Pv_2(x),$

simultaneous equation This would be compared with Bismut's result [8]. Theorem III.1 in [8] is as follows. The

$$u_1(x) = Pu_1(x) + (\varphi - u_2 - Pu_1)^+(x),$$

$$u_2(x) = Pu_2(x) - (\psi - u_1 - Pu_2)^-(x), \qquad x \in S$$
(2.29)

the formulation, and has the unique solution under Assumption 2.1, and imposing a discount factor on the payoff of

$$u(x) = u_1(x) + u_2(x), x \in S$$
 (2.30)

satisfies the optimality equation (2.8) and $\varphi(x) \le u(x) \le \psi(x), x \in S$

EXTENSION OF THE OLA RULE TO THE k-SLA RULE

the standard stopping problem (1.1) in this section. The game variant is discussed in the next Ahead rule [9] is considered. For the sake of simplicity, we do not treat the game problem, but The natural requirement of the extension from the OLA rule to the k-Step $(k \ge 1)$, the Look

Let $k \geq 1$ be a fixed integer. Define iteratively the following sequence of $d_i(x)$, $x \in$

$$d_i(x) = (P\varphi - \varphi)(x) + P(d_{i-1})^+(x), \qquad i = 1, 2, \dots, k,$$
(3.1)

where we put $d_0(x) = 0$. We will consider a region defined by

$$B^{k} = \{x \in S; d_{k}(x) \leq 0\},$$

$$C^{k} = \text{the complement of } B^{k}.$$
(3.2)

Assumption 3.1

(1) The set B^k and C^k are nonempty and the stopping set B^k is closed with respect to P;

$$P(x, B^k) = 1, x \in B^k.$$
 (3.3)

(2) The first hitting time $\nu(B^k)$ satisfies

$$\nu(B^k) < \infty \text{ a.e. } P^x, \qquad X_0 = x \in S. \tag{3.4}$$

it reaches into the stopping region, one switches to the 2-SLA rule and considers whether to procedure is as follows. First, one starts by considering the OLA (that is, the 1-SLA) rule. continue or stop, and so on. We shall refer to the k-SLA rule if the rule is based on the first hitting time $\nu(B^k)$. The

Lemma 3.1. The sequence B^i , i = 1, 2, ..., k is monotone decreasing; that is

$$B^1 \supset B^2 \supset \dots \supset B^k. \tag{3.5}$$

PROOF. It is clear because of the definition of $d_k(x)$, $x \in S$. In fact, for $X_0 = x \in S$

$$\begin{aligned} d_1(x) &= P\varphi(x) - \varphi(x) = E^x [\varphi(X_1)] - \varphi(x), \\ d_2(x) &= P\varphi(x) + P(P\varphi - \varphi)^+(x) - \varphi(x) = E^x \left[\left\{ \varphi + (P\varphi - \varphi)^+ \right\} (X_1) \right] - \varphi(x) \\ &= E^x \left[\max \left\{ \varphi(X_1), \mathbf{E}^{X_1} [\varphi(X_2)] \right\} \right] - \varphi(x), \end{aligned}$$
